

A COMPARATIVE STUDY OF DENTAL ARCH MORPHOLOGY AND TOOTH OCCLUSION

PETER JAMES TELFER, B.D.S.

Department of Restorative Dentistry
The University of Adelaide
Adelaide, South Australia.

Submitted in part fulfilment of
the requirements for the degree
of Master of Dental Surgery.

- November 1978 -

Accepted April 1979

Alternate Intercuspation.

SUMMARY

According to generally accepted concepts of tooth occlusion, the upper and lower teeth meet in maximum intercuspation when the jaw is closed into a position that is variously termed tooth position, intercuspatal position or centric occlusion. However, it has been reported that some ethnic groups, particularly pre-contemporary, display disparities in the breadths of upper and lower dental arches that prevent the teeth from occluding bilaterally in the well-known cusp to fossa and cusp to ridge relationships. This character, which is termed alternate intercuspation in this study, has not previously been quantified although it has been described in general terms by several previous authors.

The main objective of the investigation was to determine whether a statistically significant difference exists between homologous maxillary and mandibular dental arch breadths within and between Caucasoid and Aboriginal groups, and hence, whether alternate intercuspation is a measurable character.

The results indicate that arch breadths display significant inter-racial variability and sexual dimorphism within each racial group. The differences between homologous upper and lower dental arch breadths were most marked in the premolar regions of the Aboriginal male sample, and it is suggested that alternate intercuspation is a particular feature of the dental occlusion of this group.

This preliminary investigation has established that alternate intercuspation is a measurable character. However, the selection of different descriptive parameters may facilitate the characterization of this condition. Future studies based on analysis of arch shape are planned, and investigations will include comparison of arch shape between related individuals, shape changes with age, and taxonomic comparisons of dental arch shapes.

ACKNOWLEDGEMENTS

I wish to express my gratitude to the supervisors of my work for the degree.

Professor Tasman Brown, Department of Restorative Dentistry, aroused my interest in anthropology and provided guidance in my research investigation, and I am grateful for the opportunity of working with his research group.

Dr. David Parker planned and supervised the clinical and theoretical training in advanced Removable Prosthodontics which was cognate to the subsequent research work in occlusion, and I wish to express my gratitude to him for guidance and assistance during the period of my candidature.

I wish to express my thanks to the Chairmen of the Department of Restorative Dentistry, Dr. P.R.N. Beasley and later, Professor T. Brown who provided facilities for the post-graduate studies.

Dr. Grant Townsend, Department of Oral Biology has shown interest in the study and has provided helpful assistance and advice. Miss W. Lambert has assisted with the computer programming and Mrs. M. Cummings typed the essays, clinical reports and thesis.

The material used for this research investigation was obtained by the late Murray J. Barrett, University of Adelaide and acknowledgement is made of the meticulous care with which the study material was assembled.

SIGNED STATEMENT

This thesis contains no material which has been accepted for the award of any other degree or diploma in any University. To the best of my knowledge and belief, the thesis contains no material previously published or written by another person, except where due reference is made in the text of the thesis.

PETER JAMES TELFER

LIST OF TABLES

1. Variables selected for measurement.
2. Variables derived by calculation.
3. Mean differences between first and second determinations of dental arch breadths.
4. Dahlberg statistics for standard deviation of a single determination.
5. Comparison of maxillary dental arch breadths in Aborigines and Caucasoids.
6. Comparison of mandibular dental arch breadths in Aborigines and Caucasoids.
7. Sexual dimorphism in dental arch breadths.
8. Comparison of discrepancies between maxillary and mandibular arch breadths expressed as mean values.
9. Comparison of discrepancies between maxillary and mandibular arch breadths expressed as median values.
10. Frequency distribution of subjects according to the discrepancies between maxillary and mandibular arch breadths.

11. Comparison of discrepancies between maxillary and mandibular arch breadths - rank order.
12. Comparison of incisor dental arch segments.
13. Comparison of initial dental arch shape (6.2 years) with dental arch shape at various ages (9 reference points).
14. Comparison of final dental arch shape (18.0 years) with dental arch shape at various ages (9 reference points).
15. Comparison of maxillary and mandibular dental arch shapes (9 reference points).
16. Comparison of final dental arch shape (18.0 years) with dental arch shapes at various ages (11 reference points).
17. Comparison of maxillary and mandibular dental arch shapes at various ages (11 reference points).

LIST OF FIGURES

1. Dental casts of an Aboriginal subject demonstrating bilateral intercuspation according to general concepts of centric occlusion.
2. Dental casts of an Aboriginal subject demonstrating alternate intercuspation.
3. Location of Yuendumu settlement.
4. Reference points.
5. Variables measured.
6. The modified Helios dial caliper.
7. Semi-automatic system for data acquisition showing analogue-digital converter unit.
8. Cross-section through dental casts obtained from an Aboriginal displaying maximum interdigitation in centric occlusion.
9. Cross-section through dental casts obtained from a Caucasoid displaying maximum interdigitation in centric occlusion.
10. Cross-section through dental casts obtained from an Aboriginal displaying alternate intercuspation with maximum interdigitation on one side only.

11. Cross-sections through the molar region of dental casts of an Aboriginal subject at ages 9, 11 and 16.
12. Cross-sections through the premolar region of dental casts of an Aboriginal subject at ages 9, 11 and 16.
13. Aboriginal skull and mandible displaying alternate intercuspation.
14. Inferior view of the mandible and skull of a cow (*bos*).
15. Inferior view of the mandible and skull of a koala (*phascolarctus*).
16. Inferior views of the mandible and skull of a gorilla (*gorilla*) demonstrating alternate intercuspation.
17. Inferior views of mandible and skull of a macaque (*macaca*) demonstrating alternate intercuspation.
18. Computer plot of polynomial equation describing dental arches' perimeters.
19. Examples of Dührer's mesh technique used to describe facial proportions.
20. Examples of transformation grids.
21. Shape diagrams used by Goldstein and Johnston (1978).
22. Radiographic outline of a mandible at ages 13.6 and 15.6 years.
23. Computer plot of the outline of the mandible shown in Figure 22, using the method of Taylor (1971).

24. The process of production of the medial axis transformation demonstrating the intermediate steps that might be used in its manual production.
25. The photographic apparatus.
26. The height adjustment apparatus.
27. The levelling tripod.
28. Occlusal view of dental casts and reference scale.
29. Oscar strip chart recorder.
30. Comparisons of dental arch shapes (9 reference points).
31. Comparisons of dental arch shapes (11 reference points).
